Art Unit: 1771

1. Claims 1-6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. In claim 1, it is not clear what is meant by "at least one sharp edge". Does this mean that the projecting weft loops are pointed or triangular in shape? Also, it is not clear whether the claim is limited to a fabric where the coefficient of friction is increased, or whether only the cloth to cloth coefficient of friction is increased. Additionally, it is not clear what is meant by a cloth to cloth coefficient of friction or how this coefficient is measured. Similar problems exist in claim 3. In claim 2, the limitation that all the weft threads are ribbon threads renders the claim vague and indefinite because it is not clear how a lesser tension can be applied to the ribbon thread wefts than the other wefts if all the wefts are ribbon threads. Similar problems exist in claim 4.

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over GB 1,176,078 in view of JP 85047375 (Abstract). GB '078 discloses a woven fabric suitable for use to form bags which comprises warp and weft fibers in the form of flat ribbons. See col. 1, lines 10-41, and col. 3, lines 1-17. GB '078 teaches that it is preferable that the cloth comprise a plurality of projections in order to impart slip-resistance to the bag,

but GB '078 differs from the claimed invention because GB '078 does not teach forming the projections by applying less tension to at least some of the weft threads so that the weft threads will form projecting loops. JP '375 teaches that numerous projections may be formed on a woven fabric comprising warp and weft fibers by decreasing the tension on the weft fibers during weaving. JP '375 teaches that by decreasing the tension the weft fibers which form a textured, looped surface on the fabric. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have formed the projections on the woven fabric of GB'078 by reducing the tension on the weft yarns during weaving as taught by JP '375 rather than by applying an additional coating as taught in GB '078. One of ordinary skill in the art would have been motivated to employ the method taught by JP '375 because this method does not add additional steps and expense to the process of making the bags.
